Paper 3 Written Paper MARK SCHEME Maximum Mark: 75

Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the October/November 2017 series for most Cambridge IGCSE<sup>®</sup>, Cambridge International A and AS Level components and some Cambridge O Level components.

® IGCSE is a registered trademark.

Question	Answer							
1(a)	Switch Server Computer A Computer Computer Computer Computer Three lines with arrows – one from each device to switch							
1(b)	Statement True False							
	The server can send packets to Computer B and Computer C at the same time.	~		1				
	The network software on each computer needs to include collision detection and avoidance.		~	1				
	Computer B can read the packet sent from the server to Computer C.		~	1				
	Computer A can send a packet to Computer B and at the same time the server can be sending a packet ✓ 1 to Computer C.							
1(c)(i)	Device: Server 1 The server can provide a (software) firewall // The server can check all internet traffic // Server acts as proxy 1 Device: Switch 1 Internet traffic by passes the server // Server not overloaded with internet traffic // connected to all computers 1 1 mark for device, 1 mark for suitable reason							
1(c)(ii)	<ul> <li>Router acts as gateway</li> <li>Router acts as a firewall</li> <li>The LAN and the Internet are two different networks</li> <li>(may) operate on different protocols</li> <li>Router forwards packets between networks</li> <li>Router has a public IP address</li> <li>Router holds a list of local addresses</li> <li>Router translates local addresses to Internet (IP) addresses (and vice versa)</li> <li>1 mark for each point, max 2</li> </ul>							
1(c)(iii)	<ul> <li>Each packet has the IP address of the web server / destination address</li> <li>The routers use routing tables</li> <li>Routers on the Internet forward packets towards destination</li> <li>Packets can take different routes from source to destination</li> <li>Packets are reassembled in order at the web server</li> <li>1 mark for each point, max 3</li> </ul>							

Question	Answer		Marks		
2(a)	Description	Computer architecture	4		
	Most parallel computer systems use this architecture.	SIMD			
	Widely used to process 3D graphics in video games.	MIMD			
	A microprocessor is used to control a washing machine.	MISD			
	There are a number of processing units. Each processing unit executes the same instruction but on different data	SISD			
		1 mark for each correct line			
2(b)	<ul> <li>Only one (separate) processor / not many separate processors (is not massively parallel) 1</li> <li>Quad core computer system // processing units share the same bus 1</li> <li>1 mark for each point, max 2</li> </ul>				
2(c)	<ul> <li>Split into blocks of code</li> <li> that can be processed simultaneously</li> <li> instead of sequentially</li> <li>Each block is processed by a different processor</li> <li>which allows each of the many processors to simultaneously process the different blocks of code independently</li> <li>Requires both parallelism and co-ordination</li> <li>1 mark for each point, max 2</li> </ul>				
2(d)	<ul> <li>1 mark for identification of hardware issue, for example:         <ul> <li>Communication between the different processors is the issue</li> <li>1 mark for further explanation from:                 <ul> <li>Each processor needs a link to every other processor</li> <li>Many processors require many of these links</li> <li>Challenging topology</li> </ul> </li> </ul> </li> </ul>

Question	Answer	Marks				
3(a)(i)	There should be a colon before the '=' sign	1				
3(a)(ii)	The second operand should be an unsigned integer and not a variable	1				
3(a)(iii)	A32 is not a variable, as a variable should be a letter followed by a single digit	1				
3(b)	<pre><assignment_statement> ::= <variable> := 1</variable></assignment_statement></pre>	6				
	<variable> <operator> <unsigned_integer> 1</unsigned_integer></operator></variable>					
	<variable> ::= <letter> <digit> 1</digit></letter></variable>					
	<unsigned_integer> ::= <digit>   1</digit></unsigned_integer>					
	<digit> <unsigned_integer> 1</unsigned_integer></digit>					
	<letter> ::= A   B   C <operator> ::= +   -   *   ^ ]</operator></letter>					
3(c)	Variable Letter Letter Digit Digit < one mark > < one mark >	2				
	Syntax diagram shows one or two letters1Syntax diagram shows zero, one or two digits1					
3(d)	<pre><assignment_statement> ::=</assignment_statement></pre>	2				
	<variable> := <variable> <operator> <real> 1</real></operator></variable></variable>					
	<real> ::= <unsigned_integer> . <unsigned_integer> 1</unsigned_integer></unsigned_integer></real>					

Question	Answer	Marks
4(a)(i)	A (known) set of rules 1 Agreed/standard method for data transmission // governs how two devices communicate 1	2
4(a)(ii)	<ul> <li>Max 2 marks for purpose:</li> <li>Purpose of TLS is to provide for secure communication (over a network)</li> <li>maintain data integrity</li> <li>additional layer of security</li> </ul> Max 2 marks for further explanation from: <ul> <li>TLS provides improved security over SSL</li> <li>TLS is composed of two layers / record protocol and handshake protocol</li> <li>TLS protects this information by using encryption</li> <li>Also allows for authentication of servers and clients</li> </ul>	Max 3
4(b)	<ul> <li>The client validates (the server's) TLS Certificate</li> <li>The client sends its digital certificate (to the server if requested)</li> <li>Client sends an encrypted message to the server using the server's public key</li> <li>The server can use its private key to decrypt the message</li> <li> and get data needed for generating symmetric key</li> <li>Both server and client compute symmetric key (to be used for encrypting messages) // session key established</li> <li>The client sends back a digitally signed acknowledgement to start an encrypted session</li> <li>The server sends back a digitally signed acknowledgement to start an encrypted session</li> <li><b>1 mark</b> for each point, <b>max 3</b> points</li> </ul>	3
4(c)	Applications, for example: <ul> <li>online banking</li> <li>private email</li> <li>online shopping</li> <li>online messaging etc.</li> </ul> 1 mark for each point, Max 2	2
