#### **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

#### Section A

Answer all questions.

#### **Section B**

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

A Data Booklet is provided.

At the end of the examination, fasten all your work securely together. The number of marks is given in brackets [ ] at the end of each question or part question.

| For Examiner's Use |  |  |  |  |  |

4 In aqueous solution, 2-chloro-2-methylpropane,  $(CH_3)_3CCl$ , reacts with sodium hydroxide, NaOH. This is a nucleophilic substitution reaction.

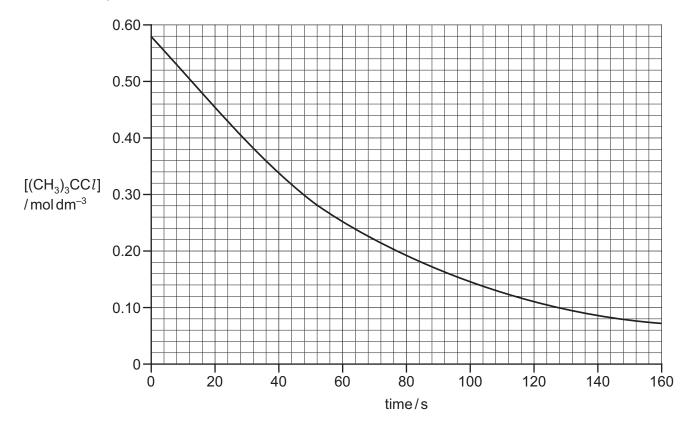

$$(CH_3)_3CCl(aq) + NaOH(aq) \rightarrow (CH_3)_3COH(aq) + NaCl(aq)$$

(a) Show the mechanism for this reaction. Include all necessary curly arrows, lone pairs and relevant dipoles.

[3]

The rate of this reaction was investigated using a **large excess** of sodium hydroxide.

**(b)** The graph below shows the results of the experiment.

|              | e reaction is first order with respect to $[(CH_3)_3CCl]$ . This can be confirmed from the graphing half-lives.                 |
|--------------|---|
| (i)          | What is meant by the <i>half-life</i> of a reaction?  |
|              |   |
|              | [1]   |
| (ii)         | Calculate the half-life for this reaction. Show all your working and show clearly any construction lines on the graph.          |
|              | [1]   |
| (iii)        | What would be the effect on the half-life of this reaction if the initial concentration of $[(CH_3)_3CCl]$ was <b>doubled</b> ? |
|              | [1]   |
| (c) (i)      | Use the graph in <b>(b)</b> to determine the rate of reaction at 80 s. Show all your working.                                   |
|              | rate = units [2]  |
| <b>T</b> L - |   |
| Ine          | e rate equation for this reaction is shown.   |
|              | $rate = k[(CH_3)_3CCl]$   |
| (ii)         | Calculate the value of the rate constant, <i>k</i> , for this reaction and give its units.                                      |
|              |   |
|              | k = units [1]   |

- 6 Boron forms many useful compounds.
  - (a) The compound diborane,  $B_2H_6$ , can be used as a rocket fuel. It can be prepared by the reaction of boron trifluoride,  $BF_3$ , with sodium borohydride,  $NaBH_4$ .

Balance this equation.

.....
$$BF_3$$
 + ..... $NaBH_4$   $\rightarrow$  ..... $B_2H_6$  + ..... $NaBF_4$  [1]

[3]

**(b)** Primary and secondary alcohols can be formed by the reaction of carbonyl compounds with NaBH<sub>4</sub>, which is a source of hydride ions, H<sup>-</sup>.

Complete the mechanism for the reaction of butanone with hydride ions, H<sup>-</sup>, and draw the intermediate in the box. Include all necessary curly arrows and relevant dipoles.

$$\begin{array}{c|c} O \\ & \\ H_3C \\ \hline \\ \vdots \\ H^- \end{array} \qquad \begin{array}{c|c} Step \ 1 \\ & \\ H \end{array}$$

(c) Borane, BH<sub>3</sub>, is used to synthesise alcohols from alkenes. The reaction occurs in two steps.

The  $BH_2$  group from  $BH_3$  bonds to the **least** substituted carbon atom of the double bond, and the remaining H from  $BH_3$  bonds to the other carbon.

(i) Suggest the *type of reaction* in step 1.

.....[1]

(ii) The diol Y can be prepared by the same method.

Draw the structure of the **diene** which could be used to prepare diol **Y**.

(i) Describe the structure of and bonding in benzene, C<sub>6</sub>H<sub>6</sub>.

(ii) Describe the structure of and bonding in benzene, C<sub>6</sub>H<sub>6</sub>.

(iii) In borazine, B<sub>3</sub>N<sub>3</sub>H<sub>6</sub>, the boron and nitrogen atoms alternate around the ring. Each ring atom has a single hydrogen atom bonded to it.

All boron-nitrogen bonds in borazine are 0.154 nm and 0.136 nm respectively.

[1]

[Total: 10]

Suggest and draw the structure of borazine.

**7 (a)** Sunset Yellow is a yellow colouring agent used in food and drinks, which can be made by the following route.

In step 3 of this synthesis, a phenol-like compound, **S**, reacts with intermediate **T** made from amine **R**.

Assume that the –SO<sub>3</sub>-Na<sup>+</sup> group does not react.

Sunset Yellow

(iii) What type of organic salt is formed in step 2?

(b) Compound  ${\bf W}$  has the following structure.

$$H_2N$$
 $O$ 
 $NH_2$ 

| (i) | How many | $\sigma$ and $\pi$ | bonds are | present in a | molecule | of W? |
|-----|----------|--------------------|-----------|--------------|----------|-------|
|-----|----------|--------------------|-----------|--------------|----------|-------|

| σ bonds | $\pi$ bonds | [2 | 21 |
|---------|-------------|----|----|
|         |             | L- | -1 |

(ii) The products of the reactions of **W** with cold HC*l* and with CH<sub>3</sub>CH<sub>2</sub>Br are soluble in water but **not** in organic solvents.

Complete the table for these reactions of  $\boldsymbol{W}.$ 

| reagent  | structure of product (molecular formula given)      | type of reaction |
|----------|---|------------------|
| HC1      | $(C_4H_9N_2OCl)$                                    |                  |
| CH₃CH₂Br | (C <sub>6</sub> H <sub>13</sub> N <sub>2</sub> BrO) |                  |

### **Section B**

Answer **all** the questions in the spaces provided.

**8** (a) The sequence of bases in DNA is a code for the order of amino acids in the primary structure of proteins.

The diagram represents the stages involved in the formation of a protein from DNA.

(i) Identify the biochemical structures,  $\bf A$  and  $\bf B_1$ ,  $\bf B_2$  etc.

| biochemical structure                              | identity |
|--|----------|
| Α  |          |
| <b>B</b> <sub>1</sub> , <b>B</b> <sub>2</sub> etc. |          |

[2]

(ii) Name the biochemical processes involved in stages 1 and 3.

| process | name of biochemical process |
|---------|-----------------------------|
| stage 1 |                             |
| stage 3 |                             |

[1]

(b) Adenine is an integral part of DNA.

adenine

|     |       | adenine  |     |
|-----|-------|--|-----|
|     | (i)   | State the molecular formula of adenine.  |     |
|     |       |  | [1] |
|     | (ii)  | Identify the three <b>other</b> nitrogenous bases in DNA.  |     |
|     |       |  | [1] |
|     | (iii) | DNA has a double helical structure that consists of two strands linked together.   |     |
|     |       | What type of bonding exists between the  |     |
|     |       | phosphate and sugar groups within a DNA strand,  |     |
|     |       | different bases on the two strands?  |     |
|     |       |  | [2] |
| (c) | The   | breakdown of adenosine triphosphate, ATP, provides the energy for many cellular reaction   | ns. |
|     |       | ATP + $H_2O \rightarrow ADP + P_i$   |     |
|     | Wha   | at type of chemical reaction is this?  |     |
|     |       |  | [1] |
|     |       |  |     |
| (d) | orga  | ay crystallography can be useful in obtaining information about the structures of lar<br>anic molecules, such as ATP. The technique involves X-rays interacting with the electro<br>in the molecule. | _   |
|     | (i)   | Which element in the molecule of ATP will interact most strongly with the X-ray beam?  |     |
|     |       |  | [1] |
|     | (ii)  | Explain why X-ray crystallography will <b>not</b> detect hydrogen atoms.   |     |
|     |       |  |     |
|     |       |  | [1] |

[Total: 10]

**9** (a) Some metals are essential to biochemical processes.

Complete the following table naming one metal in each case.

| biochemical process             | metal |
|---------------------------------|-------|
| haemoglobin in oxygen transport |       |
| transmission of nerve impulses  |       |
| enzyme cofactor                 |       |

[2]

| (b) | Enz   | zymes are a special type of protein molecule that catalyse biochemical reactions.  |     |
|-----|-------|--|-----|
|     | Exp   | plain briefly the mechanism by which an enzyme breaks down a substrate molecule.   |     |
|     |       |  |     |
|     |       |  |     |
|     |       |  |     |
|     |       | [  | [3] |
| (c) |       | ulfide bonds play an important role in the stability of some proteins such as the keratin  | in  |
|     |       | nan hair.<br>e amino acid involved in the formation of a disulfide bond is cysteine, H <sub>2</sub> NCH(CH <sub>2</sub> SH)CO <sub>2</sub> l | Н.  |
|     | (i)   | At which level of protein structure (primary, secondary, tertiary) are disulfide bonds formed  | ?   |
|     |       | [  | [1] |
|     | (ii)  | Use a functional group in cysteine to show how disulfide bonds are formed.   |     |
|     |       |  |     |
|     |       |  |     |
|     |       |  |     |
|     |       |  |     |
|     |       |  |     |
|     |       |  |     |
|     |       |  | [1] |
| (   | (iii) | What type of chemical reaction is this?  | [1] |

(d) The NMR spectrum of cysteine,  $H_2NCH(CH_2SH)CO_2H$ , shows five absorptions.

After shaking a solution of cysteine with a few drops of  $D_2O$ , the NMR spectrum shows **only two** absorptions, **E** and **F**, shown below.

| (i)  | Identify the <b>two</b> types of protons responsible for the absorptions <b>E</b> and <b>F</b> . |       |
|------|--|-------|
|      | E  |       |
|      |  |       |
|      | F  | [1]   |
|      |  |       |
| (ii) | State and explain the splitting patterns of the absorptions <b>E</b> and <b>F</b> .              |       |
|      | E  |       |
|      |  |       |
|      |  | ••••• |
|      | F  |       |
|      |  |       |
|      |  | [2]   |
|      |  |       |

[Total: 11]

10 (a) Aspartame is an artificial sweetener that has the structure shown below.

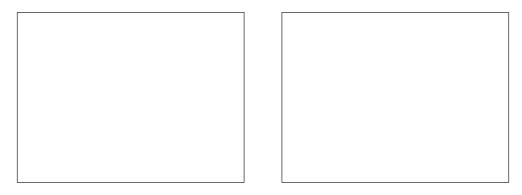

aspartame

(i) Draw a circle around each chiral centre in aspartame.

[1]

In the stomach, aspartame is hydrolysed by acid to form three organic products.

- (ii) On the diagram above, use arrows to indicate the **two** bonds that would be hydrolysed in the stomach. [2]
- (iii) Draw the structures of the **three** products formed after complete acid hydrolysis of aspartame.

[3]

| (b) | Aspartame is soluble in water.   |
|-----|--|
|     | By referring to the structure of aspartame, explain why it is soluble in water.  |
|     |  |
|     |  |
|     | [2]  |
| (c) | Recently, nanotechnology has been involved in the development of a new natural sweetener, <i>Nano Sugar</i> , extracted from sugar cane. |
|     | What is the approximate width of a nanoparticle?   |
|     | [1]  |
|     | [Total: 9]   |
