## Extract for Question 1

### Africa's growing mobile (cell) phone market

The use and ownership of mobile phones in Africa are increasing at a dramatic rate. The population coverage of mobile networks increased from 10% in 1999 to 60% in 2007 and is forecasted to grow to 90% by 2012. The rise in the supply of mobile phones is most rapid in rural areas.

It is interesting to note that advances in technology are being brought to Africa more by means of mobile phones than by means of computers (see table below).

### Ownership of mobile phones and computers in selected countries 2007

Country	Per 100 population	
	Mobile phones	Computers
African countries:		
Kenya	20.9	1.4
Nigeria	24.1	0.8
South Africa	83.3	8.5
Western countries:		
Germany	103.6	60.6
United Kingdom	116.6	75.8
United States	77.4	76.2

There are a number of reasons why the demand for mobile phones is increasing so rapidly in Africa. One is the fall in their price. The mobile phone companies are bringing out low priced models for the African markets. Another reason is increasing awareness of the benefits mobile phones can bring. These benefits include not only being able to keep in touch with family and friends but also helping buyers and sellers contact each other. TradeNet, a software company based in Accra, Ghana, provides a service which lets buyers and sellers of agricultural products exchange contact information and indicate what they would like to trade. Services offered by mobile phone companies increase the efficiency of trade and help reduce market failure.

Mobile phone companies clearly benefit from the growth in sales in Africa. For instance, Globacom, a Nigerian private limited company, and Safaricom Kenya, a joint venture between Telkom Kenya and the multi-national company Vodafone Group, are both experiencing increasing revenues and profits. African governments are also finding that they can increase their revenue by selling mobile phone licences and imposing corporate taxes on the profits of mobile phone companies.

**Extract for Question 2****United States (US) unemployment reaches new heights**

More Americans lost their jobs in 2008 than in any year since 1945. In December 2008, 524 000 Americans were made redundant and unemployment rose by 470 000. The loss of jobs continued into the start of 2009. In April 2009, the unemployment rate in the US was 8.9%. This contrasted with an unemployment rate of 4.8% in Japan. Some economists, nevertheless, claimed that economic performance in the US was stronger than Japan's and so the US Government was closer to achieving its policy aims than the Japanese Government.

The rise in unemployment in the US was widespread across industries and was accompanied by a change in the number of hours Americans worked. In December 2008, the average weekly hours worked by Americans fell to 33.3. This was the lowest number of hours worked per week since records began in 1964. Some full-time workers had their hours reduced and other workers were forced into part-time work because they could not find full-time employment.
