READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.
DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.
You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.
Fig. 1.1 shows a diagram of a cross-section of a dicotyledonous leaf, as seen using a light microscope.

(a) (i) Name tissue A and cell B.

A ......................................................................................................................................................

B ...................................................................................................................................................... [2]

(ii) Describe two ways in which tissue A is adapted for maximum photosynthesis.

1 ......................................................................................................................................................

 ......................................................................................................................................................

2 ...................................................................................................................................................... [2]
(b) Plants use carbon dioxide for photosynthesis.

(i) Describe where and how carbon dioxide enters a leaf.
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................

[Total: 12]
Coat colour in cattle is inherited in a very similar way to blood groups in humans. The gene for coat colour has two codominant alleles:

- \( C^B \) which is the allele for brown coat
- \( C^W \) which is the allele for white coat.

Table 2.1 shows the genotypes and phenotypes of different coat colours seen in a herd of cattle.

<table>
<thead>
<tr>
<th>genotype</th>
<th>phenotype</th>
</tr>
</thead>
<tbody>
<tr>
<td>( C^B C^B )</td>
<td>brown</td>
</tr>
<tr>
<td>( C^W C^W )</td>
<td>white</td>
</tr>
<tr>
<td>( C^B C^W )</td>
<td>roan</td>
</tr>
</tbody>
</table>

(a) (i) Explain the term codominance.
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
........................................................................................................................................... [2]

(ii) A farmer crossed several roan coloured cows with a roan coloured bull. Complete the genetic diagram to show the ratio of expected phenotypes among the offspring.

parental phenotypes
roan cow \( \times \) roan bull

parental genotypes
\( C^B C^W \) \( \times \) \( C^B C^W \)

gametes
........................................................................................................................................

offspring genotypes
........................................................................................................................................

offspring phenotypes
........................................................................................................................................

phenotypic ratio
........................................................................................................................................... [4]
(b) A farmer has a herd of cows that produce milk. The farmer wants to improve the milk yield of the herd by using artificial selection (selective breeding). The farmer buys semen (fluid containing sperm) to inseminate the cows artificially.

(i) Describe how the farmer could improve the milk yield of the cows using artificial selection.

[Total: 13]
Question 3 begins on page 8.
Excretion is the process of removing waste products of metabolism from the body.

(a) Name the two main products of metabolism that need to be excreted from the human body.
.............................................................................................................................................. [2]

(b) The kidney is one of the main excretory organs of the body. Its role is to filter the blood. Some substances leave the blood and are removed from the body in the urine. The concentration of protein in the blood entering the kidneys in the renal arteries is 83 g dm\(^{-3}\).

State the concentration of protein that you would expect in the urine of a healthy person and explain your answer.

concentration ................................ g dm\(^{-3}\)

explanation ................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
.............................................................................................................................................. [2]

(c) Dialysis can be used to treat people whose kidneys do not function properly.

Fig. 3.1 shows dialysis treatment.

Key

→ movement of blood
⇒ movement of dialysis fluid
→ movement of substances in and out of blood

Fig. 3.1
Use Fig. 3.1 to describe the process of dialysis and explain changes that occur in a person’s blood.

...................................................................................................................................................

...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................
................................................................................................................................................... [5]

(d) Some people with kidney failure are given a kidney transplant.

State one advantage and one disadvantage of having a kidney transplant instead of dialysis treatment.

advantage ..........................................................................................................................................
...................................................................................................................................................

disadvantage ..........................................................................................................................................
................................................................................................................................................... [2]

(e) The liver is another excretory organ of the body. The liver breaks down hormones and drugs, such as alcohol.

(i) State one function of the liver other than the breakdown of hormones and drugs.

...................................................................................................................................................
...................................................................................................................................................
................................................................................................................................................... [1]
(ii) Describe two effects on the body of long-term, excessive consumption of alcohol.

1 ...........................................................................................................................................

...........................................................................................................................................

2 ...........................................................................................................................................

...........................................................................................................................................

........................................................................................................................................... [2]

(iii) Suggest one social implication of alcohol misuse.

...............................................................................................................................................

............................................................................................................................................. [1]

[Total: 15]
Question 4 begins on page 12.
Fig. 4.1 shows the structure of a typical fish.

Fig. 4.2 shows four species of freshwater fish, A, B, C and D.

A  Haplochromis nyrerei
B  Protopterus dolloi
C  Salmo trutta
D  Polyodon spathula

Not drawn to the same scale
Biologists use dichotomous keys to identify different species.

Describe one visible feature of each species of fish A, B, C and D, that could be used to distinguish it from the other three species in Fig. 4.2.

Only use descriptions of the features labelled in Fig. 4.1 in your answers.

Write your answers in Table 4.1.

(b) Pollution is harm done to the environment by release of substances produced by human activities. Acid rain is one form of pollution that damages many lakes, ponds and rivers.

(i) State one pollutant that causes acid rain.
.............................................................................................................................. [1]

(ii) Fig. 4.3 shows the effect of pH on the mean number of species of fish found in lakes in New York State, USA.

![Fig. 4.3](image)

Describe the results shown in Fig. 4.3.

Question 5 begins on page 16.
Many flowering plants can reproduce sexually and asexually.

(a) (i) Define the term *asexual reproduction*.
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
........................................................................................................................................ [2]

(ii) State **one advantage** and **one disadvantage** of asexual reproduction for flowering plants.

advantage ........................................................................................................................................
........................................................................................................................................
........................................................................................................................................
disadvantage ....................................................................................................................................
........................................................................................................................................
........................................................................................................................................ [2]

(b) Fig. 5.1 shows a potato plant, *Solanum tuberosum*, grown from a tuber. The tubers that potato plants are grown from are commonly referred to as seed potatoes.
(i) Define the term *growth*.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
........................................................................................................................................... [2]

(ii) Potatoes can reproduce asexually by means of tubers. The parent plant produces underground stems, which eventually form tubers.

With reference to Fig. 5.1, describe how tubers are formed from the underground stems in potatoes.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
........................................................................................................................................... [3]
(c) A student conducted an experiment to investigate the percentage change in mass of potato tuber tissue when placed in different concentrations of sucrose solution. The potato tuber tissue was cut into cubes of the same size.

Fig. 5.2 shows a graph of the results.

![Graph of percentage change in mass vs. concentration of sucrose solution]

Fig. 5.2

(i) Use Fig. 5.2 to predict the percentage change in mass of a cube of potato tuber tissue placed in 1.2 mol dm\(^{-3}\) sucrose solution.

................................................................................................................................................................[2]
(ii) Explain the results shown in Fig. 5.2 in terms of water potential:

- between sucrose concentrations of 0.0 – 0.4 mol dm\(^{-3}\)
- at sucrose concentration 0.4 mol dm\(^{-3}\)
- between sucrose concentrations of 0.4 – 1.0 mol dm\(^{-3}\).

\[
\begin{align*}
\text{between 0.0 – 0.4 mol dm}^{-3} & \quad \text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{at 0.4 mol dm}^{-3} & \quad \text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{between 0.4 – 1.0 mol dm}^{-3} & \quad \text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\text{...........................................................................................................} \\
\end{align*}
\]

[5]
(d) Pollination is the transfer of pollen from the anther to the stigma. Pollen can be transferred to the stigma by being carried by the wind or by animals.

Fig. 5.3 shows a photograph of a wind-pollinated flowering plant.

Fig. 5.3

(i) State two structural adaptations of a flower for wind-pollination.

1 ............................................................................................................................................ 

2 ............................................................................................................................................ [2]

(ii) State how self-pollination differs from cross-pollination.

............................................................................................................................................... 

............................................................................................................................................... 

............................................................................................................................................... [1]

(iii) Suggest one reason why self-pollination might be advantageous to a population of plants.

............................................................................................................................................... 

............................................................................................................................................... 

............................................................................................................................................... [1]

[Total: 20]
6 Fig. 6.1 shows changes in the global human population between 1910 and 2010.

![Graph showing population growth from 1910 to 2010.](image)

**Fig. 6.1**

(a) Improved food production has contributed to the increase in the human population.

(i) State and explain two ways in which modern technology has resulted in increased food production.

............................................................................................................................................
............................................................................................................................................
............................................................................................................................................
............................................................................................................................................
............................................................................................................................................
............................................................................................................................................ [2]

(ii) State one reason, other than food production, why the human population has increased so rapidly between 1910 and 2010.

............................................................................................................................................
............................................................................................................................................ [1]
(b) In view of the increasing human population, people are sometimes encouraged to eat less meat and more fruit and vegetables, to improve the energy efficiency of their food supply.

Explain why eating less meat and more fruit and vegetables is more energy efficient.
