Paper 1

## 7516/1

Monday 6 June 2016
Morning
Time allowed: 1 hour 30 minutes
For this paper you must have access to:

- a computer
- a printer
- appropriate software
- the Electronic Answer Document
- an electronic version and a hard copy of the Skeleton Program
- an electronic version of the Data File
- an electronic version and a hard copy of the

Preliminary Material.
You must NOT use a calculator.
[Turn over]

## INSTRUCTIONS

- Type the information required on the front of your Electronic Answer Document.
- Before the start of the examination make sure your CENTRE NUMBER, CANDIDATE NAME and

CANDIDATE NUMBER are shown clearly in the footer of every page of your Electronic Answer Document (not the front cover).

- Enter your answers into the Electronic Answer Document.
- Answer ALL questions.
- Save your work at regular intervals.

## INFORMATION

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 75.
- No extra time is allowed for printing and collating.
- The question paper is divided into THREE sections.

## ADVICE

You are advised to allocate time to each section as follows:

SECTION A - 20 minutes; SECTION B - 20 minutes; SECTION C - 50 minutes.

## AT THE END OF THE EXAMINATION

Tie together all your printed Electronic Answer Document pages and hand them to the Invigilator.

## WARNING

It may not be possible to issue a result for this paper if your details are not on every page of your Electronic Answer Document.

## SECTION A

You are advised to spend no more than 20 MINUTES on this section.

Enter your answers to SECTION A in your Electronic Answer Document. You MUST save this document at regular intervals.

The questions in this section ask you to write program code starting from a NEW program/project/file.

You are advised to save your program at regular intervals.

| 01 | In question parts | 0 | 1 | 1 | and | 0 11.2 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | two statements are given followed by two conclusions numbered 1 and 2.

You must assume the two statements given in each question are true.

Read the statements and then decide which of the given conclusions logically follows from the two given statements.

Write the letter corresponding to your answer in your Electronic Answer Document.

| :--- | :--- | :--- | The algorithm, represented using pseudocode in FIGURE 4, describes a method to calculate the additive or multiplicative persistence of a two-digit integer. The examples below illustrate how additive and multiplicative persistence are calculated.

EXAMPLE: calculating the additive persistence of 87
$8+7=15$
$1+5=6$
After 2 steps the method results in a one digit answer so the additive persistence of 87 is 2.

EXAMPLE: calculating the multiplicative persistence of 39

3* $9=27$
$2 * 7=14$
1 * $4=4$
After 3 steps the method results in a one digit answer so the multiplicative persistence of 39 is 3 .

## SECTION C

You are advised to spend no more than 50 MINUTES on this section.

Enter your answers to SECTION C in your Electronic Answer Document. You MUST save this document at regular intervals.

These questions require you to load the Skeleton Program and to make programming changes to it.

| 0 | 9 | This question refers to the subroutine |
| :--- | :--- | :--- | GetRowColumn.

What you need to do:

## TASK 1

Adapt the program source code for the subroutine GetRowColumn so that it checks that the ROW entered by the player is in the allowed range.

If an invalid value is entered for the row the program should output:
Invalid value entered

The subroutine should not return any values until a valid row has been entered.

## TASK 2

Test that the changes you have made work by conducting the following test:

- run the Skeleton Program
- select option 2 from the menu
- fire a shot at column 6, row 10
- fire a shot at column 6, row 9.

Evidence that you need to provide:
Include the following evidence in your Electronic Answer Document.

| :--- | :--- | This question will extend the functionality of the game.

The game needs to be changed so that a message is displayed when all the squares occupied by a ship have been hit.

FIGURE 6 shows an example of this functionality of the game using the board from the training game.

## FIGURE 6

The player has made three shots and achieved 2 hits and a miss.

The player's next shot into column 7, row 9 is a third hit and sinks the ship.
The game displays the message 'Destroyer is sunk!' to the player.

| 9 |  |  |  |  | m | h |  | h | h |  |  |

What you need to do:

## TASK 1

Create a new subroutine CheckSunk that, when given the current shot location, board and list of ships, will:

- check the board to find out which kind of ship has been hit
- reduce, by one, the number of squares occupied by that ship in the list of ships
- display the message ' Xx is sunk!' where xx is the type of the ship, if the ship now occupies zero squares.

## TASK 2

Modify the MakePlayerMove subroutine so that the subroutine CheckSunk is called when appropriate.

## TASK 3

Test your program works by conducting the following test:

- run the Skeleton Program
- select option 2 from the menu
- fire a shot at column 1, row 3
- fire a shot at column 1, row 4
- fire a shot at column 1, row 5.

| 1 | 1 | This question will further extend the |
| :--- | :--- | :--- | functionality of the game.

The game is to be altered so that a player has the option of firing either a standard shot or a torpedo.

The player can only fire a torpedo once during the game.

If a player decides to fire a torpedo it behaves in the following manner:
a. if the torpedo lands directly on a ship (even if this part of the ship has already been hit) it behaves like a standard shot and explodes resulting in the square being marked as a hit and an appropriate message is displayed
b. if the torpedo lands in an empty square or a square already marked as a miss then the torpedo keeps moving up one square until it either hits a ship or moves off the board
c. each square that the torpedo has moved from will be marked as a miss
d. if the torpedo moves into a square that is occupied by a ship this will cause a hit like a standard shot (even if this part of the ship has already been hit), the torpedo will be removed from the board and an appropriate message is displayed
e. if the torpedo moves off the board it will disappear and an appropriate message is displayed.

You can choose to display the board each time the torpedo moves or to display the board only after the torpedo has finished moving.

FIGURES 7 to 9 show an example of a torpedo being used.

## FIGURE 7

A torpedo is fired at column 8, row 6 and does not hit a ship.

At this stage no change is made to the contents of the board as the torpedo did not achieve a direct hit.

What you need to do:

## TASK 1

Create a new subroutine
MakePlayerTorpedoMove that when given a current board:

- asks the player to enter the row and column
- fires a torpedo starting at the square indicated by the player.

The torpedo should behave as described in points a-e on pages 30-31.

## TASK 2

Adapt the PlayGame subroutine so that, if the player has not already fired a torpedo during the game, the player is asked:

```
Fire a torpedo? (Y/N)
```

If the player responds ' N ' a standard shot should be fired.

If the player responds ' $Y$ ' the subroutine MakePlayerTorpedoMove should be called.

## TASK 3

Test your program works by conducting the following test:

- run the Skeleton Program
- select option 2 from the menu
- fire a torpedo at column 1, row 7
- fire a standard shot at column 2, row 1.
